

Figure 1.3
Phase II Offsite Well Sampling Location
Santa Susana Field Laboratory

U.S. EPA Region 9

The recent United States Environmental Protection Agency (EPA) study revealed Radiological Contamination off-site at the American Jewish University's Brandeis-Bardin Campus (BBI), this should be added into the work plan along with a sampling effort and understanding of a flowing pipe in the Western area of the BBI as seen below...

The red water storage tank (above left) has been empty for several years. Yet an unknown source of water, possibly a spring flows freely all year round. The BBI has taken the authority to install signs to make sure the campers do not allow their horses to drink this water. This raises the question, have they done their own testing and where are the results? From my understanding this was not sampled in the recent EPA radiological Background Study and Historical Site Assessment paid for by over 38 Million Dollars in Obama Stimulus monies.
