

There were two of these Underground Flammable Liquid Storage tanks that were rigged with hoses and pipes that direct into the OS-21 well. The above left photo indicates the contents TOOK THE RUST OFF THE TANK. These are obvious "Injection" style devices as the tanks appear to be hand-titled with wood posts to get the contents out of the tanks and into the hole in the ground/Groundwater Aquifer. The logic behind the hits of TCE become more valid. In the Draft Groundwater Report, discovered was elevated gross alpha and beta in the American Jewish University's Brandeis-Bardin Campus (as seen below) and we need to make sure other OS wells are at non-detect.
